INTRODUCTION

Problem gambling among youth is a growing public health concern. While gambling activities are predominantly viewed as an innocuous adult pastime, more underage youth, exposed to the widespread availability of regulated and unregulated forms of gambling, are succumbing to the temptation and pressures to engage in these activities [Jacobs, 2000; National Research Council (NRC), 1999]. Similar to adults, research reveals that problem gambling during adolescence can lead to adverse outcomes such as strained relationships, delinquency and criminal behaviour, depression and even suicide (Derevensky and Gupta, 2004). Such negative outcomes have short- and long-term implications for the individual, significant others, as well as for society at large (Derevensky et al., 2003). Yet, despite these negative consequences, problem gambling in youth has only recently emerged as a significant public health concern (Korn and Shaffer, 1999). To date, little effort has been made to respond to this important adolescent risk behaviour.

The prevailing attitudes of governments and the general population indicate that new gambling venues (e.g. casino expansion) will continue to rapidly expand. Gambling, or gaming (the widely accepted industry terminology), is no longer a vice accompanied by negative connotations and stigmatization but rather a legitimate form of entertainment. Today’s lottery corporations deliberately associate the proceeds of lottery sales with funding of public education and health/social welfare initiatives. There is also literature which discusses the potential health-related benefits (Korn and Shaffer, 1999).
However, gambling continues to remain a contentious social policy issue worldwide. [See reports from the US National Gambling Study Impact Commission (National Opinion Research Center, 1999), Canada West Foundation (Azmier, 2000), the National Centre for the Study of Gambling, South Africa Report (Collins and Barr, 2001).]

Gambling has become a popular form of recreation for adolescents. While legislative statutes generally prohibit youth from participating in legalized forms of gambling, there is little doubt that they engage in both legal and illegal forms of gambling. Research in Canada, the US and internationally suggests that upwards of 80% of adolescents have engaged in some form of gambling during their lifetime (see reviews by the NRC, 1999, and meta-analysis by Shaffer and Hall, 1996).

Most alarming, however, is evidence indicating that between 4 and 8% of adolescents have a very serious gambling problem, while another 10–15% are at-risk (Derevensky and Gupta, 2000; Jacobs, 2000). While there are some methodological issues involved in the measurement of pathological gambling for youth, there are consistent reports that adolescent prevalence rates of pathological gambling (4–8%) are higher than the general adult population (1–3%) (NRC, 1999; Derevensky et al., 2003).

Trends between 1984 and 1999 point to a significant increase in the proportion of youth who report gambling within the past year and those who report gambling-related problems (Jacobs, 2000). In the US and Canada, it is estimated that approximately 15.3 million 12–17 year olds have gambled, while 2.2 million are reported to be experiencing serious gambling-related problems (Jacobs, 2000). While most adolescents report having gambled for money (NRC, 1999), the lure of excitement, entertainment and financial freedom accompanying gambling is particularly attractive to youth. This, coupled with a general lack of prevention and awareness programmes, may render youth particularly vulnerable to the risks and negative consequences associated with gambling.

Gambling problems in adolescents have often gone unnoticed as they are difficult to measure and observe (Derevensky and Gupta, 1998). In contrast to alcohol, tobacco and other drug use, there are no visible signs of intoxication or consumption. Furthermore, problem gambling remains socially invisible and masked by popular misconceptions. Moreover, advertising and the mass media have succeeded in legitimizing and destigmatizing gambling (Zangeneh et al., In press).

COSTS AND CONSEQUENCES

Research has demonstrated that problem gambling among adolescents has been associated with a number of other mental health outcomes including higher rates of depressive symptomology, increased risk of alcohol and substance abuse disorders (Hardoon et al., 2002), increased risk of suicide ideation and attempt, higher anxiety (Gupta and Derevensky, 1998) and poor general health (Potenza et al., 2002). Further, these adolescents, relative to their peers, are at increased risk of delinquency and crime, disrupted familial/peer relationships and poor academic performance (Wynne et al., 1996). The consequences borne by youth experiencing gambling-related problems are serious, and the damage can be devastating to the adolescent, and his/her peers and family.

The degree of potential costs of problem gambling in youth can be measured along a continuum of gambling risk. Individuals who gamble infrequently, or in a low-risk manner, have few, if any, negative outcomes. At this level, Korn and Shaffer (1999) suggest that most people enjoy some degree of pleasure, enjoyment or benefit. As one moves up the continuum of gambling risk, the negative outcomes begin to outweigh any potential benefits. As a result, adolescent gamblers begin to experience a wide array of impaired personal, health and social consequences.

DETERMINANTS AND RISK FACTORS

Problem gambling is governed by a complex set of interrelating factors, causes and determinants ranging from biology and family history to social norms and existing statutes. An ecological approach to health behaviour requires one to view gambling behaviour from multiple perspectives. Proposed by McLeroy et al. (1988), an ecological health promotion model focuses on addressing health behaviour from both an individual and socio-environmental level; strategies are directed at shifting intrapersonal, interpersonal,
institutional, community and public policy factors. It is the interplay of these five factors that determine one’s propensity to develop a gambling-related problem (Jacobs, 1986). An ecological perspective on gambling predicates moving beyond simply offering problem gamblers treatment and counselling; instead, interventions work at modifying all five levels within this multi-dimensional model (see Table 1).

Intrapersonal and interpersonal level factors have been the focus of considerable research, treatment and prevention programmes in the past. There is extensive research outlining the many intrapersonal risk factors, as well as the effects of parents, peers and family on the acquisition, development and maintenance of gambling problems (for a review of the substantial empirical research outlining risk factors and correlates see Derevensky and Gupta, 2004). However, more research is needed to better understand the role of community factors such as civil/local organizations, social norms, socio-economic variables and the media in shaping social identity, norms, values, beliefs and behaviours regarding gambling. The aetiology of gambling behaviour and problems, although still not fully understood, includes the interaction of both biological and psycho-social factors.

Institutional structures, regulations and policies either promote or hinder health behaviour and outcomes. The gambling industry’s policies/practice on the development of products and venues, their promotion and sale, and the enforcement of existing legal statutes prohibiting access to minors are important determinants of gambling participation and behaviour. Yet, retailers and venue operators lack the knowledge and motivation to properly enforce such statutes. Furthermore, some school practices may unwittingly be promoting gambling through fundraising activities including lottery/raffle draws, casino nights and permitting card playing

within schools. These institutional factors can be viewed as targets for change; they can be challenged and modified to help create healthy organizational culture and practices.

Public policy factors related to gambling intersect a number of different domains including social, educational, health, economic, legislative and judicial. The rapid expansion of the gambling industry is a global phenomenon. Governments around the world continue to control and regulate gambling in a manner that promotes and sustains economic benefits. In an effort to recoup losses, governments have sought various means to bolster the economy, reduce deficits and increase revenues (Campbell and Smith, 1998). Under economic constraint many governments have become highly dependent on gambling revenues and are reluctant to change regulations in favour of more sound public health policies. Applying political economy theories to gambling, Sauer (Sauer, 2001) maintains that gambling expansion has been driven by the need for larger governments to generate greater revenue. Legislation on advertising and promotion, laws regulating minimum age-requirements and their enforcement, provision of programmes for harm minimization, fiscal measures and regulation on the availability of products are examples of public policy initiatives that can influence the social environment and minimize unhealthy behaviour. Clearly, however, policies need to balance public health interests with the economic gains to governments and the industry.

**POPULATION-BASED APPROACH**

Rose (Rose, 1992) aptly noted that ‘mass diseases and mass exposures require mass remedies’ (p. 95). Accordingly, gambling expansion and the rising number of youth with gambling problems need to be conceptualized as a community/social issue and not merely the problem of sick individuals, reflecting a medical model. Without addressing the underlying causes and factors that result in individuals developing a gambling problem, a flow of new individuals (incidence cases) will continue. Public health and gambling professionals must refocus from the individual to society, and seek to balance high-risk strategies with those that strive to address gambling issues from a societal perspective.

Although only a small minority of youth develop gambling problems, and most adolescents who gamble experience few negative effects, from a public health and population-based perspective, the greater the number of young ‘social’ gamblers that exist, the greater the potential for more youth to develop a gambling addiction. In order to significantly reduce the overall prevalence of gambling-related problems in youth, public health strategies must focus on shifting the continuum of risk downward (i.e. reducing the number of young at-risk and high-risk gamblers as well as preventing low-risk youth from becoming at-risk) by addressing the individual, environmental and socio-economic determinants of gambling.

**RECOMMENDED ACTION**

The Youth Gambling Risk Prevention Model, Figure 1, illustrates (a) the continuum of gambling risk, (b) the primary, secondary and tertiary prevention intervention points, (c) the related prevention objectives for each level of risk along the continuum and (d) the recommended health promotion strategies required to achieve the prevention objectives. This model emphasizes the importance of addressing youth gambling behaviour along a continuum and the need for different forms of intervention to address each level of risk.

The benefit of this model is that it is bidirectional and delineates two main trajectories: a risk continuum and a prevention pathway. The risk continuum moves from no-risk to at-risk and from at-risk to gambling problems. The prevention pathway moves in the opposite direction and aims to reverse the risk at every level along the continuum. The three prevention points impede the progression at each stage in the gambling risk continuum. Further, the model links clusters of health promotion strategies to prevention objectives outlined at all three levels of risk. The health promotion strategies should be designed, tailored and implemented to address and achieve every objective as per the needs of individual communities.

Derevensky et al. (Derevensky et al., 2001) conducted a comprehensive review of existing gambling prevention initiatives and concluded that while empirical knowledge of the prevention of youth gambling problems and its translation into science-based initiatives is very limited, the emergent field of youth gambling can make use of the considerable literature and prevention initiatives on adolescent alcohol and substance...
Youth gambling problems: a public health perspective

use given their many similarities. As such, the strategies and recommendation presented here are theory-based and require implementation and empirical evaluation in order to begin to develop the evidence-base necessary for best practices.

Primary prevention
Youth who do not gamble or gamble infrequently are categorized under no-risk on the continuum; the majority of young people (80%) would fall under this level of risk (Derevensky and Gupta, 1998). Their behaviour does not currently place them at risk, however, this does not suggest that there is no need for public health intervention on a population level. In fact, since a large percentage of youth gamble a potential exists for increased gambling and problems (Gupta and Derevensky, 1998).

Primary prevention strategies aim to prevent the onset of at-risk gambling behaviour and maintain youth at the healthy end of the continuum. Primary prevention objectives include increasing knowledge and awareness of the risks and consequences of at-risk gambling for not only the adolescents themselves, through school-based programmes, but for their parents, professionals and the general public. To date, there have been few attempts at such a goal and those that have been implemented lack empirical evaluation (NRC, 1999).

Public education measures, such as social-marketing and the use of the media, are important measures given that adolescents’ attitudes about gambling may be formed through marketing and promotion of gambling in the mass media (Griffiths, 2002) and modelling of parents and peers (Hardoon et al., 2002). Such strategies help persuade the public to question the social acceptability of underage gambling and have the potential to influence social norms. In order to be effective, however, public education

[Fig. 1: Youth Gambling Risk Prevention model.]
strategies need to be part of an integrated approach, which includes implementing healthy public policy that modifies the existing environment, thereby enabling behaviour change. In addition, involving the community in the development and implementation of programmes and the policy-making process may strengthen public support, enhance community capacity and improve public knowledge and perception of the risks of youth gambling.

Advocacy for healthy public policy on regulating and limiting the expansion of gambling in communities may help foster a more supportive environment—one where gambling is curtailed and less visible to minors. Given that age of onset is a significant risk-factor (Derevensky and Gupta, 2004), increasing the age of first exposure to gambling participation by limiting the availability of gambling products and venues is a necessary goal. Information programmes for retailers on the importance of enforcing age restrictions increases the point of purchase barriers for youth trying to gamble. There also remains a need to develop standards and policies regulating the promotion and marketing of gambling products and venues, in light of research suggesting that youth are adversely affected by advertising tactics (Griffiths, 2003) (for a detailed discussion of social policy issues see Derevensky et al., 2004). Without the development of policies that foster an environment supportive of behaviour change, educational programmes at the community or school level are not likely to be effective (Campbell et al., 1999).

Secondary prevention
Approximately 10–15% of youth are at-risk of developing a severe gambling problem, experiencing one or more negative consequences associated with their gambling while not meeting the DSM criteria (Shaffer and Hall, 1996). Nevertheless, these youth exhibit multiple signs of problematic gambling behaviour, and without appropriate secondary prevention they remain at an increased risk for pathological gambling.

Secondary prevention attempts to avert at-risk youth from escalating towards pathological gambling and includes early identification strategies. For example, by developing and implementing effective professional education and training programmes for primary health care workers (e.g. physicians, school counsellors, social workers), adolescents can be more easily identified. With appropriate education and training, professionals will have the knowledge and resources needed to understand the risks, recognize the signs of early gambling troubles in underage youth, and respond effectively.

Organizational development, including policy development, is yet another approach used to influence health services. This includes developing standards of care oriented towards gambling prevention. For example, outpatient facilities including clinics and community health centres can offer staff training on how to identify, assess, and provide brief intervention to youth that may be at-risk of developing a gambling problem. Staff should also have at their disposal the resources and tools needed to respond to youth gambling issues, including access to gambling screens, information pamphlets, treatment guidelines and referral contacts.

Programmes founded on a harm-reduction approach inform youth of the risks and dangers associated with gambling, and help them develop the necessary skills to remain in control, however such programmes do not advocate abstinence (Single, 2001). Relatively few gambling prevention or sensitization programmes exist and those prevention programmes that are being implemented lack empirical validity as to their effectiveness (Derevensky et al., 2001). Harm-reduction strategies need to identify and target at-risk youth, including communities and/or schools known to have gambling problems. Evidence-based harm-reduction and outreach programmes need to form part of an overall gambling prevention approach. (For a complete discussion see Dickson et al., 2004.)

Tertiary prevention
Adolescents engaging in excessive gambling and experiencing multiple serious gambling-related problems are considered to be problem or pathological gamblers. Symptomatic of pathological gambling is a continuous or periodic loss of control over gambling, irrational thinking, a preoccupation with gambling and with obtaining money to gamble, as well as a continuation with gambling behaviour despite adverse consequences, and an inability to stop in spite of their desire to do so [American Psychiatric Association (APA), 1994].

Tertiary prevention strategies aim to increase access and availability of treatment, services and support. Such treatment services can be developed specifically for gambling, or gambling
Youth gambling problems: a public health perspective

75
treatment can be incorporated into existing
addiction programmes. Marketing services as
free, confidential and youth-friendly may help
increase the utilization of these services. It is
essential that treatment programmes be tailored
to the needs and developmental age of each
individual (see Derevensky et al., 2001). The
promotion of referral services and telephone
helplines is also important. Telephone helplines
are confidential and easily accessible, and may be
an ideal vehicle for youth to ask questions, obtain
information and acquire referrals to services.

FRAMEWORK FOR ACTION

The Framework for Action (Figure 2) depicts an
overall structure to guide public health action in
the area of youth gambling. The Ottawa Charter
for Health Promotion [World Health Organisa-
tion (WHO), 1986] forms the basis for action
within this framework. Drawing upon the
Charter's five action areas—development of
personal skills, strengthening community action,
creating supportive environments, reorienting
health services and building healthy public
policy—this model can help direct and shape
public health action for the prevention of youth
gambling. The five pillars of health promotion
represent the foundation upon which public
health goals are achieved. The framework
emanates from the bottom with the five health
promotion action areas, and flows upward to the
four gambling-related goals. Within each stage,
the framework guides and directs action towards
achieving the principal public health goals,
attainable through a multi-level approach.

The four public health goals—denormalization,
prevention, protection and harm-reduction—
although independently relevant and important
are reciprocally related, and together address the
spectrum of issues underlying gambling problems.
Denormalization, within the context of youth
problem gambling, assumes social de-normalization,
where society begins to question and assess
underage gambling. Similar to the strategies
incorporated in tobacco prevention, denormal-
ization includes drawing attention to the
marketing strategies employed by the gambling
industry, influencing social norms and attitudes on

---

Fig. 2: A public health policy Framework for Action.
Increasing the visibility of youth problem gambling, challenging current myths and misconceptions among youth and the general public, and promoting realistic and accurate knowledge of the impact of youth gambling.

Prevention in the area of youth problem gambling should incorporate the following aims: increasing knowledge and awareness of the risks of excessive gambling among youth, professionals and the general public; promoting informed decision-making among individuals; the early identification and treatment of youth experiencing gambling problems or at-risk of developing one; helping youth develop problem-solving, coping and social skills required for healthy development; and minimizing harm of gambling problems in youth, their families and communities.

Governments, the industry and the public have a responsibility to protect children and adolescents from potentially harmful products. This goal aims to protect youth from exposure to gambling products and promotion through effective institutional policy and government legislation thereby reducing the accessibility and availability of all state regulated gambling to underage youth. Further, efforts to protect youth from the direct and indirect marketing of gambling products and venues is required.

Harm-reduction focuses on preventing the specific problem behaviour from developing. As an overall goal, harm-reduction should be targeted to all youth, especially those at-risk, thereby decreasing the potential negative consequences of excessive gambling.

Health promotion strategies that develop personal skills aim to help youth, parents, and professionals acquire accurate knowledge and skills required to make sound decisions concerning gambling behaviour. Professionals and parents, if alert, can identify, protect or support youth who may be experiencing a gambling problem or at-risk for developing a problem.

Strengthening community capacity is an important prerequisite for action in addressing youth gambling problems. Effective public health action must be formulated with an appreciation of the history of each community and appropriate within the local context. Approaches that seek to educate and empower communities will ultimately bring gambling issues to the policy agenda. Raising the visibility and awareness of the burden of gambling within communities can help catalyse action toward policy and community development. Furthermore, the importance of increasing the visibility of youth problem gambling to those in a position that affect policy changes should not be overlooked. Political commitment may be acquired by emphasizing our social responsibility to protect youth. Facilitating communication and dissemination of information on the social consequences of problem gambling and the preventability can garner political support for public health action.

Creating supportive environments includes fostering a physical, socio-economic, political and cultural environment that promotes the health and well-being of individuals and of society. Policy development necessitates promoting barriers in order to restrict access to gambling venues. Environments where children and youth live and play should be supportive and conducive to their developmental needs and to their life skills and decision-making ability.

Building healthy public policy consists of implementing strategies that promote healthier choices through government legislation, regulation and fiscal measures while advocating for the development of responsible social policy. All governmental sectors have a responsibility to develop policies and regulations, provide a duty of care that limit/monitor the expansion of gambling in communities, fund research examining the social and health impact of gambling, enforce existing regulations and statutes, as well as regulate advertising and marketing of gambling to youth.

Reorienting health services in primary care settings and social services care facilities would ensure that professionals working with youth are sensitive to their unique needs, able to identify potential gambling problems, and intervene when necessary. Professional training can help ensure that early identification and support for gambling problems is provided. Health centres and organizations need to provide appropriate gambling prevention and treatment programmes. Science-based treatment programmes should be readily available and easily accessible in communities.

Assuming that despite the possible barriers to adopting a public health approach (see Korn et al., 2003) policy makers, professionals and other proponents embrace it, this theoretical framework helps direct health promotion action on multiple levels, and suggests a range of strategies needed to achieve and attain public health goals. However, given that the framework is theory-based, further evaluation of its applicability and of any confounding issues is needed.

Action are summarized in Table 2. As well, suggestions for future directions are provided.

**CONCLUSIONS**

The burden of problem gambling among children and youth remains under-recognized. Our current knowledge and understanding of the magnitude of the problem and its considerable impact upon the health and well-being of youth compels us to respond in a timely, effective and pragmatic manner. Examining youth problem gambling along a continuum of possible and real risk necessitates setting prevention objectives in order to prevent the onset, reduce the risk, and minimize the negative consequences of gambling problems among youth.

A public health approach incorporates a multi-dimensional perspective, recognizes the individual and social determinants, draws upon health promotion principles, and applies population-based theory. As such, a public health framework remains a pro-active approach to addressing youth gambling. Governments should not minimize this issue. This is an important social and public health policy concern which will continue to grow. Our youth remain particularly vulnerable to the lure of gambling and require our immediate attention.
